

Forensic science is not an oxymoron, it is a discipline in itself

Alphonse Bertillon

“The aim is not to condemn somebody because his measurements correspond to those of another person. We provide only items of information. We provide just a name useful for the examination. It is up to the inquiry to ascertain the exactness, using criminal records, testimonies, etc. It is easy to see that if the information, obtained from anthropometric considerations, is corroborated *a posteriori* by other evidence, it will become an absolute certainty for the court.”

Bertillon A. De l'identification par les signalements anthropométriques. Archives de l'anthropologie criminelle et des sciences pénales. 1886;1:193-223.

Edmond Locard: about the expert

“The physical certainty provided by scientific evidence rests upon evidential values of different orders. These are **measurable** and can be **expressed numerically**. Hence the expert knows and argues that he knows the truth, but only within the limits of the risks of error inherent to the technique.

This numbering of adverse probabilities should be explicitly stated by the expert. The expert is not the judge: he should not be influenced by facts of a moral sort. His duty is to ignore the trial.”

Locard E. L'enquête criminelle et les méthodes scientifiques. Paris: Ernst Flammarion; 1920.

Edmond Locard: about the judge

“...with regard to forensic science, the duties of the judge are clear: the judge must be able to **understand** forensic technology and to **evaluate results** and their **respective strengths**; otherwise his personal conviction would be made relying blindly on the expert.

It is the judge's duty to evaluate whether or not a single negative presumption, against a sextillion of probabilities, can prevent him from acting.”

Locard E. L'enquête criminelle et les méthodes scientifiques. Paris: Ernst Flammarion; 1920.

Progress in Forensic Science

> I believe that if we want to do any progress in forensic science, we shall:

- ① Abandon unsupportable claims of **individualization**.
- ② Redefine the **logical underpinning of our reporting schemes**.
- ③ When possible, provide opinions that can be supported by **empirical and disclosable data**.

What do you mean by
“certain” ?

It means that, on Earth,
nobody else but the
suspect can be the
source of the mark

“Earth population
paradigm”

Let's consider *a priori*
10 billion individuals

Recall, this the **Earth
population paradigm**

What **strength of evidence** do we
need to obtain a reasonable degree
of scientific certainty ?

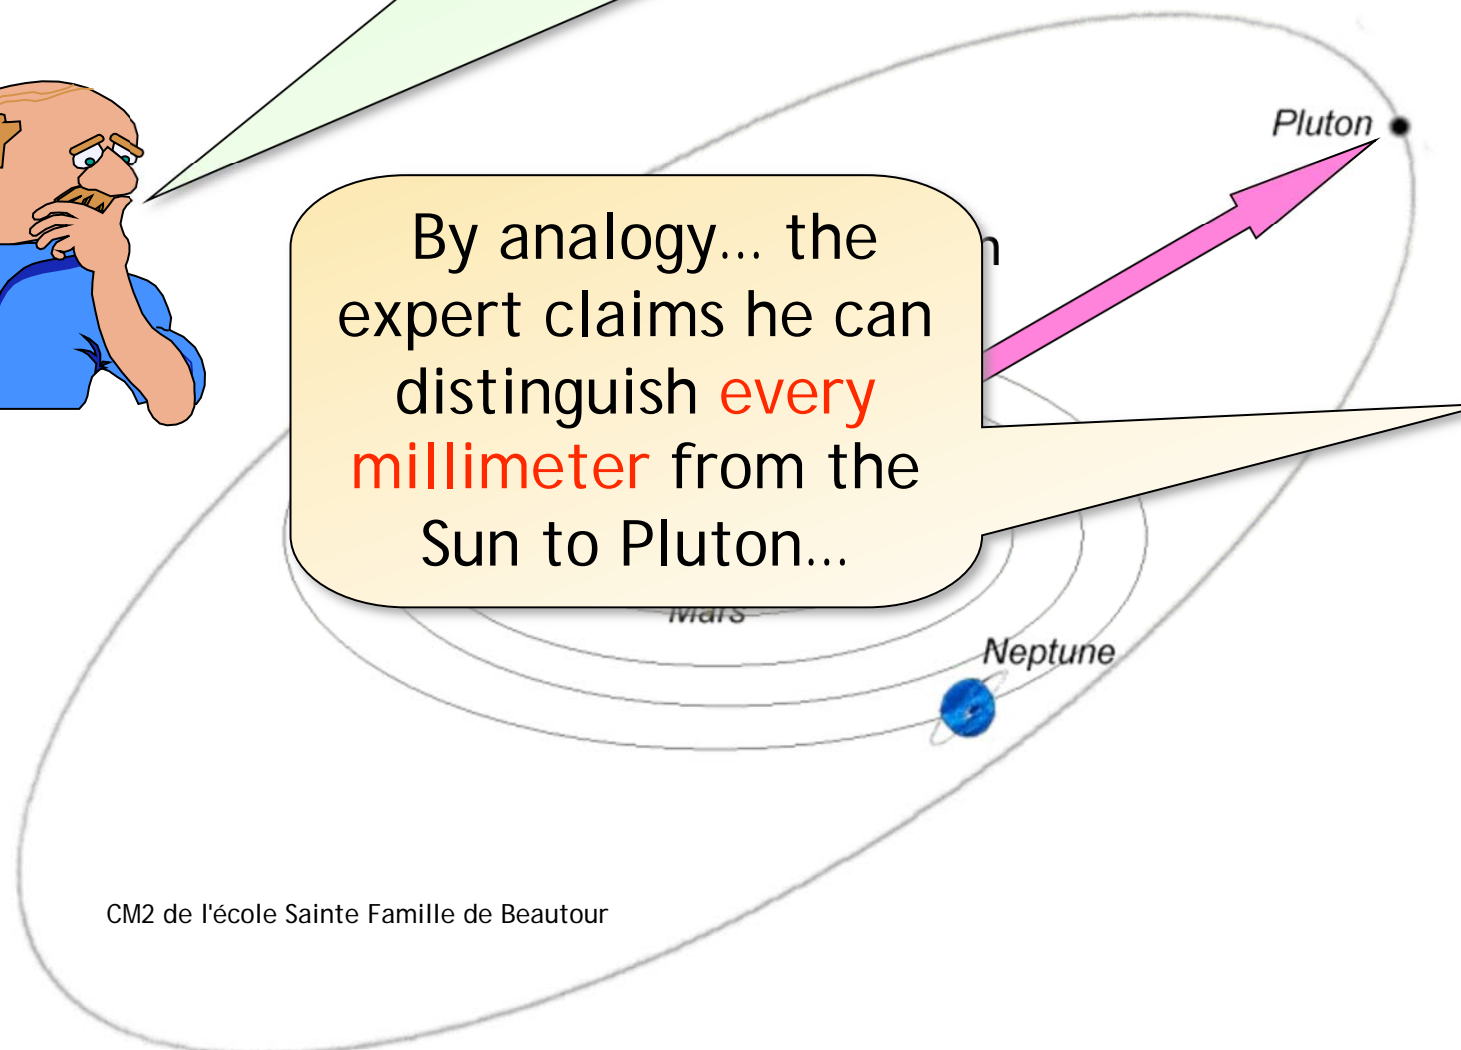

Mr DOE is **one
among 10
billion**

Mr DOE has left the
mark to a **reasonable
degree of scientific
certainty**

Hence we talk about a **likelihood ratio** of the order of 10^{15} or more

By analogy... the expert claims he can distinguish **every millimeter** from the Sun to Pluton...

① Individualization

We shall move away
from the Earth
population paradigm

And completely **abandon the
concept of individualisation**

There is no need to be
certain to be useful

The likelihood ratio associated with the features at hand exceeds 10^9

...and this provides **extremely strong support** for the view that the mark has been left by the same finger as the print as opposed to an unknown finger

Neumann C, Champod C, Puch-Solis R, Meuwly D, Egli N, Anthonioz A, et al. Computation of Likelihood Ratios in Fingerprint Identification for Configurations of Three Minutiae. *J For Sci.* 2006;51(6):1255-66.

Egli NM, Champod C, Margot P. Evidence evaluation in fingerprint comparison and automated fingerprint identification systems--Modelling within finger variability. *Forensic Sci Int.* 2007;167(2-3):189-95.

Forensic Expert Opinion

Balance?

Logic?

If we can get the logic right - then
this helps us to maintain balance

Probability of the evidence given the prosecution case

Probability of the evidence given the defence case

The single most important advance in forensic science thinking is the realization that the scientist should address the *probability of the evidence*

The ratio (called the likelihood ratio - LR) of these two determines the way that the scales of justice are tilted by the scientific evidence

② Reporting Scheme

> It should be based on sound logical principles

LR	
$> 10^6$	Extremely strong evidence to support H_p
10^5 to 10^6	Very strong evidence to support H_p
10^3 to 10^5	Strong evidence to support H_p
10^2 to 10^3	Moderate evidence to support H_p
>1 to 10^2	Limited evidence to support H_p
1	Inconclusive, the findings does not help to progress towards H_p or H_d

Unfortunately, the reporting scales currently proposed by document examiners, footwear mark examiners, firearms/toolmarks examiners do not stand scientific scrutiny

Support opinions with relevant data

Was Q (left) fired by the same gun (SIG 9mm parabellum) as K (right)?

Measurements with Nanofocus μ scan

Primer Cup Cutting

Automatic segmentation of the primer cup by exploiting normal vectors

ICP - Iterative Closest Point

Firing Pin Mark Alignment

ICP - Iterative Closest Point

Firing Pin Mark Alignment

③ Informed opinion with data

Comparisons between Q and 50 cartridges cases fired by this gun

Within source

$LR > 10^9$

Comparisons between Q and 80 cartridges cases fired by different guns (SIG 9mm)

Between sources

Distributions of two similarity measures

Progress in Forensic Science

> I believe that if we want to do any progress in forensic science, we shall:

- ① Abandon unsupportable claims of **individualization**.
- ② Redefine the **logical underpinning of our reporting schemes**.
- ③ When possible, provide opinions that can be supported by **empirical and disclosable data**.
